NeoPUF -The Holy Grail of Security

Establishing an unforgeable identity for

every chip, creating the ultimate

foundation for zero-trust security.

Quantum-Proof Security: PUF based HSM Edge Server for PQC Migration

Chiplet Supply Chain Secured by NeoPUF

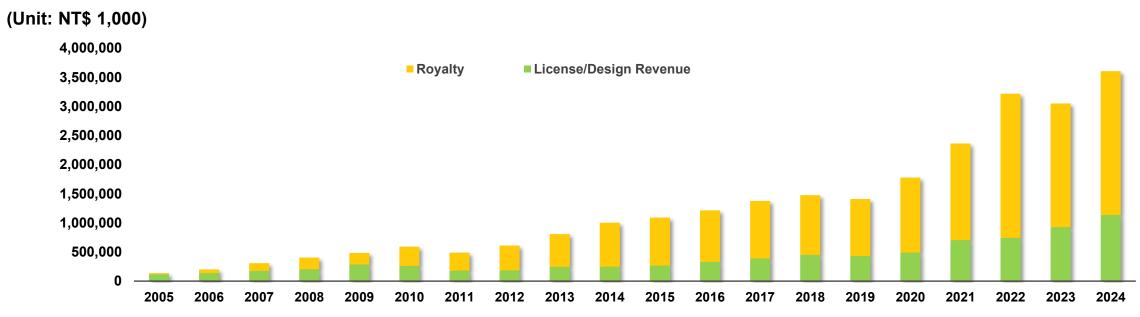

Transforming hardware security into a scalable service, protecting critical data and infrastructure from cloud to edge.

Extending trust boundaries to secure the future of heterogeneous computing and integration.

公司介紹。

eMemory is the global leader of embedded non-volatile memory IP

Revenue Trend

Founded In 2000

Based in Hsinchu, Taiwan. IPO in 2011. Over 69M wafers shipped.

1300+ Patents Issued

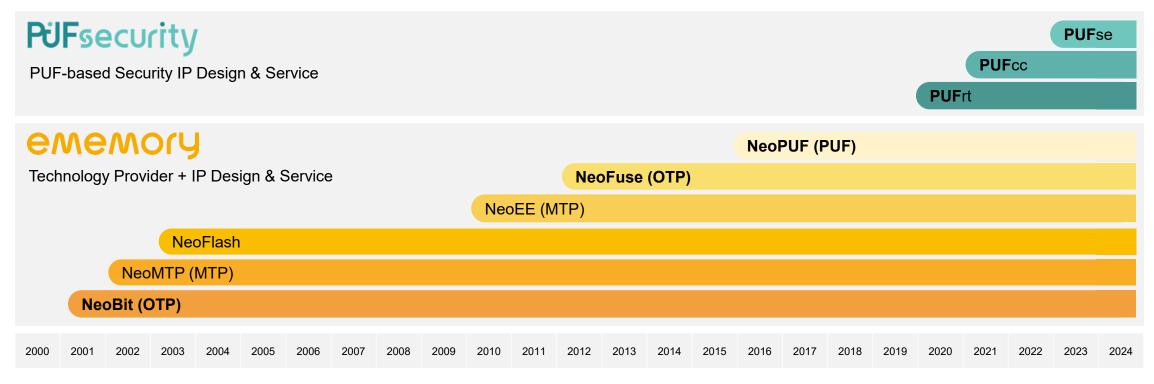

214 pending patents. 360 employees with 69% R&D personnel.

Best IP Partner

TSMC Best IP Partner Award since 2010.

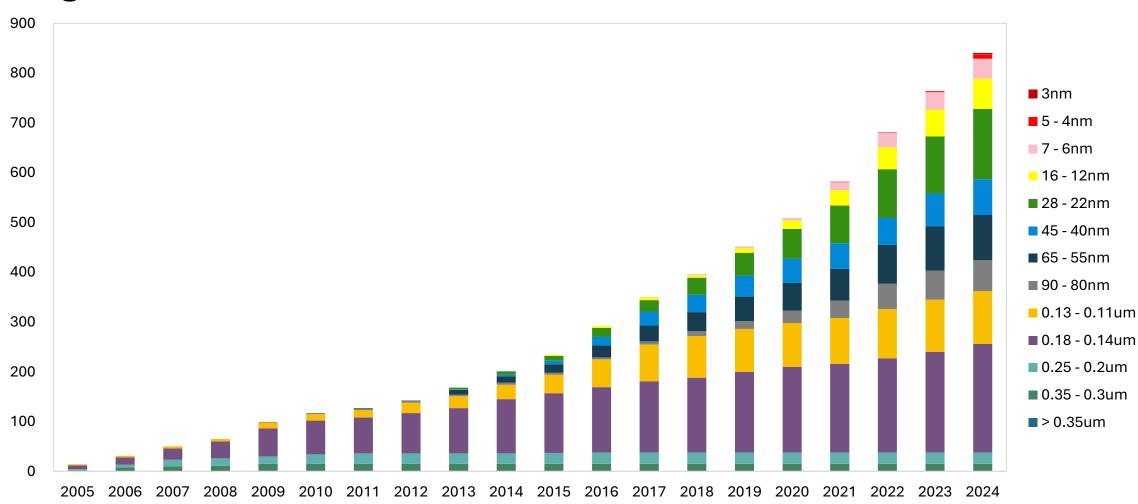

公司產品技術。

With access to eMemory's widely verified IP process platform, PUFsecurity is uniquely positioned to provide **OTP and PUF-based** Security IP Solutions with **extensive availability** across various foundries and process nodes.

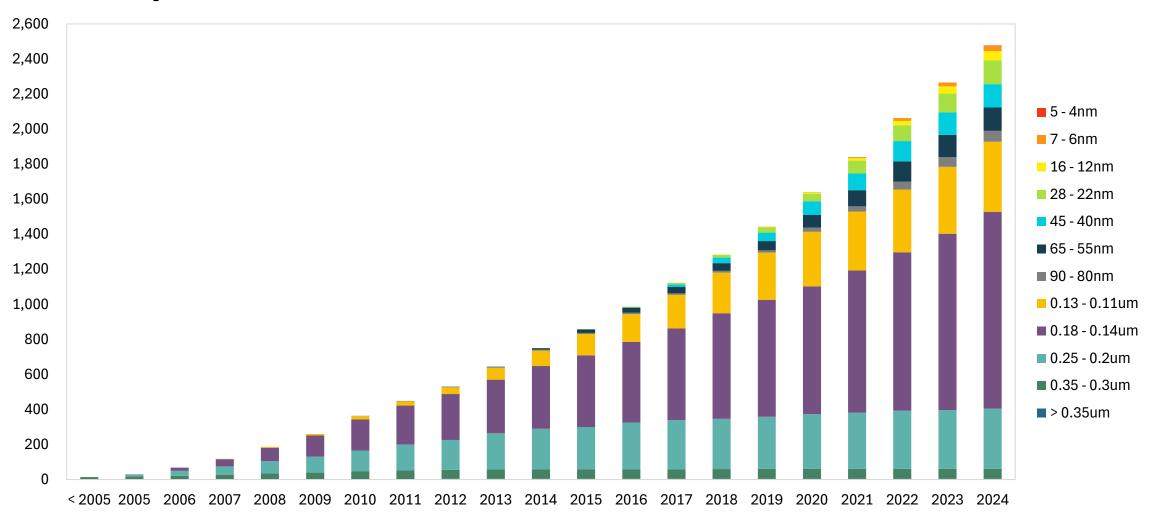

Registered IPs at TSMC -

^{*}NTO stands for **New Tape-Out**

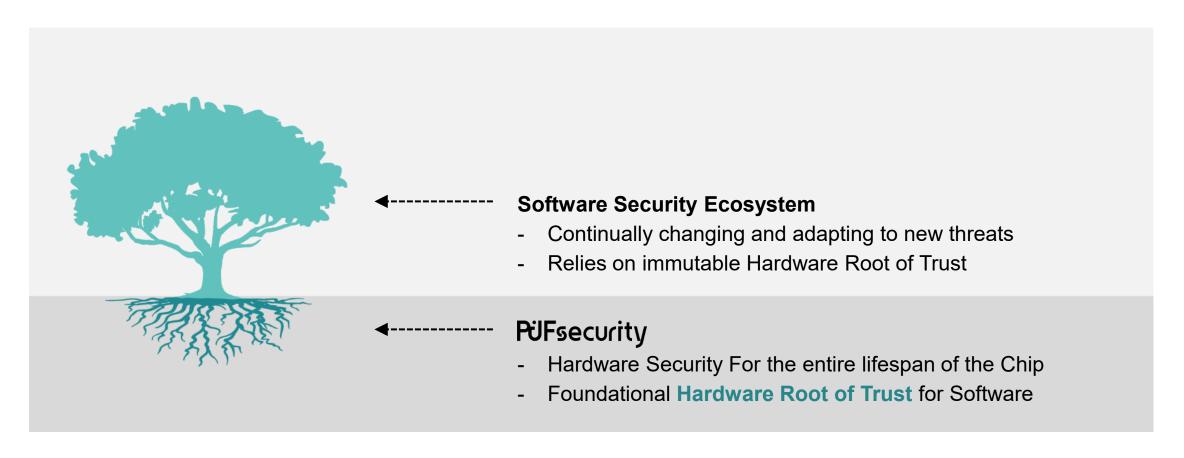

^{*} Revenue includes both **licensing** and **royalty**

Evolution from **OTP** to **PUF-HSM**

- Based on OTP technologies, many different security function IPs have evolved
- Hardware Security has evolved from SecureOTP to a full PUF-Based Security Subsystem

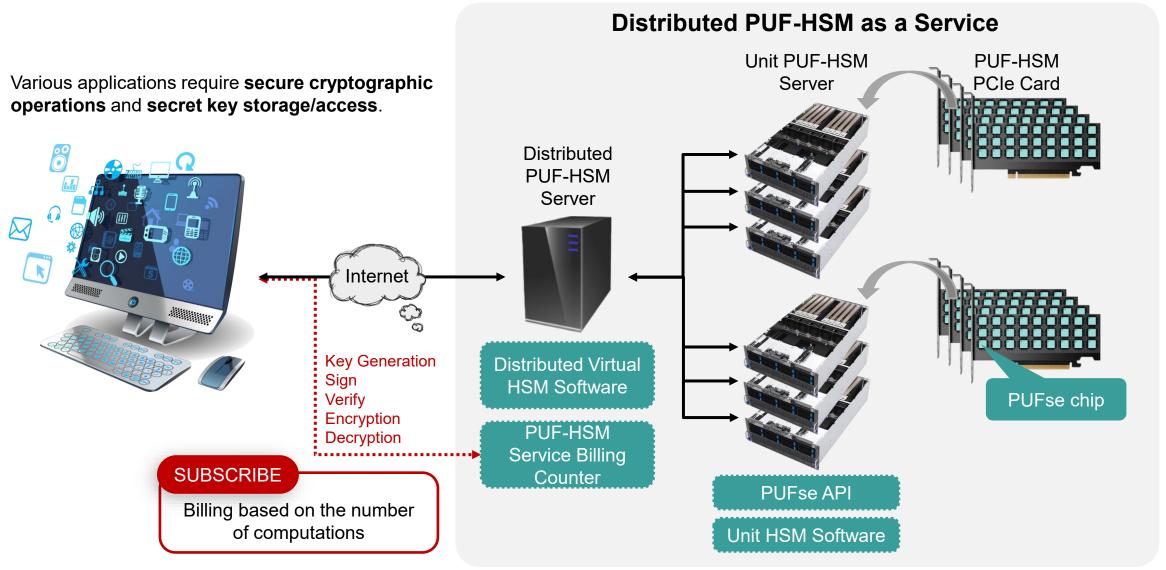

The Foundation of the Security Ecosystem -

page 11 eMemory

Distributed **PUF-HSM** as a Service

page 12

Standards Drive Hardware-Based Security.

Driving an open standard for silicon root of trust

Using asymmetric public/private key encryption technology and device ID to achieve fast and secure access to the network

Security Business Development -

 As eMemory is an established IP company, there are different platforms that we can leverage for sales in security IPs and sub-systems

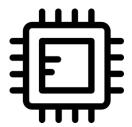

Foundry Platforms

TSMC, Intel, UMC, GF, etc.

- Licensed our security technology to major foundries
- Co-promotional activities

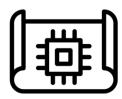

CPU Partners

Arm, RISC-V, Cadence, etc.

 SoC customers looking for both CPU and security subsystems

CSP

More to come

 Work with CSP and system companies for embedded security on a chip level

page 14 eMemory

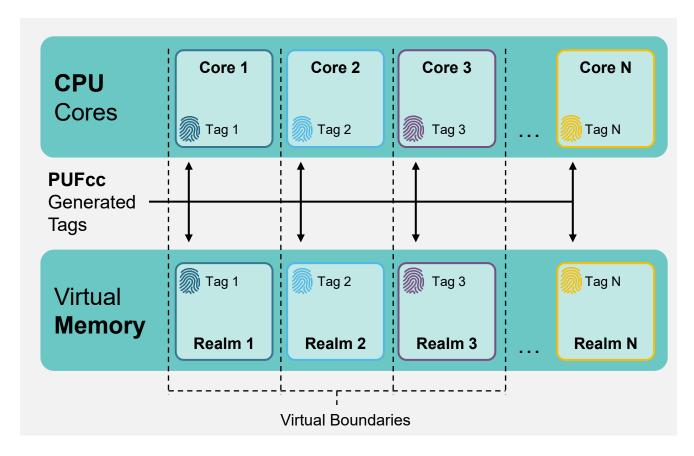

Market **Application** -

Customers with many different applications will begin to adopt PUF-based Security Solutions

CPU	AI	SSD		
DPU	DTV/STB	Wi-Fi		
FPGA	ISP	And More.		

page 15

Next Computing: Confidential Computing -

- Protect data in the Virtual Memory of Multi-Core CPUs
- CPU Cores and Virtual Memory have unique corresponding tag numbers
- Tag numbers are internally randomly generated by PUFcc (Crypto Coprocessor IP)

page 16 eMemory

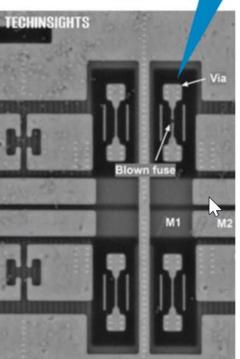

AntiFuse OTP vs. eFuse

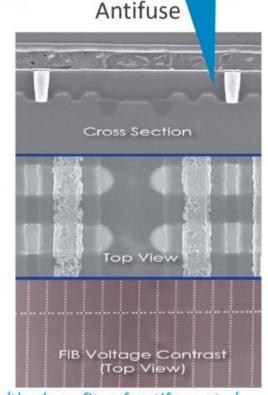

One Time Programable (OTP) memory is a SoC-wide resource

Metal fuse state can be read in an SEM Gate lines run across many words, thus preventing recovery of data

- RSS supports OTP as field-programmable to store confidential code and data
- eFuse:
 - Area efficient for smaller arrays
 - Typically not field programmable
 - Can be easily read by delayering SoC (a few \$k cost)
 - The secure channel key can be compromised
 - The device can then be cloned
- Antifuse OTP:
 - Cannot be read using a scanning electron microscope
 - Dense bit cells, efficient for large arrays
 - Macro periphery is large versus eFuse
 - Integrated charge pump enables field programming
 - · PUF can be included for a small additional area
 - ~0.04mm2 on 7nm for 128x32 bit PUF

eFuse

New Energy Cars

Why is High-Density SRAM needed in AI?

To increase the speed of Al accelerators, **high-density SRAM** is needed for use in:

Buffer Memory

 High-density SRAM helps improve data transfer speed and reduce energy costs by acting as a fast intermediate storage between different processing stages.

Al Model Training

 High-density SRAM helps store vast amounts of data for AI accelerators to access quickly to speed up training.

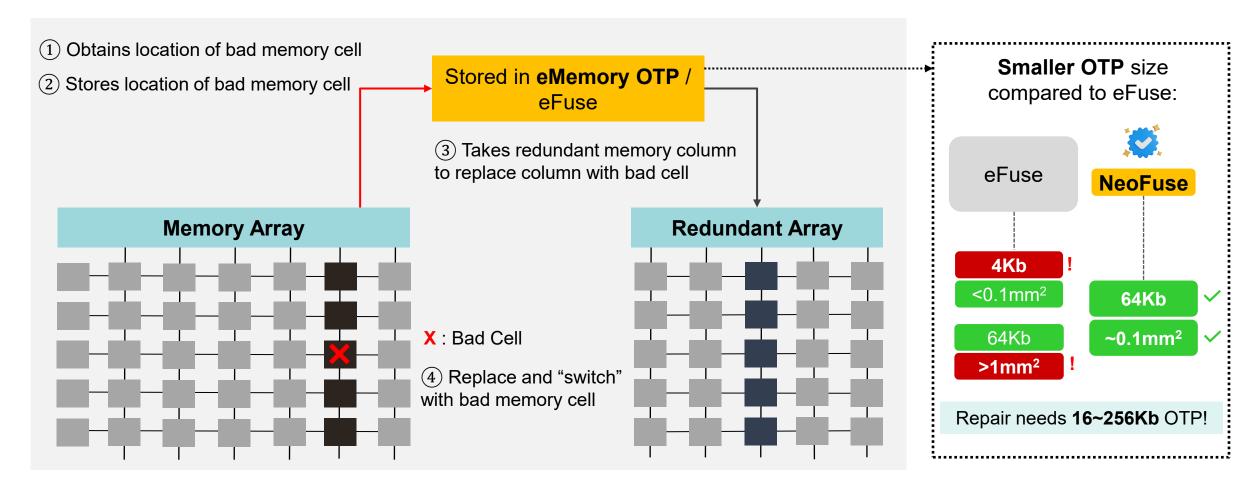

Computing in Memory (CIM) for Inference

 High-density SRAM enables in-memory computation by storing large datasets and performing computations on them without transferring data to separate processors.

page 24

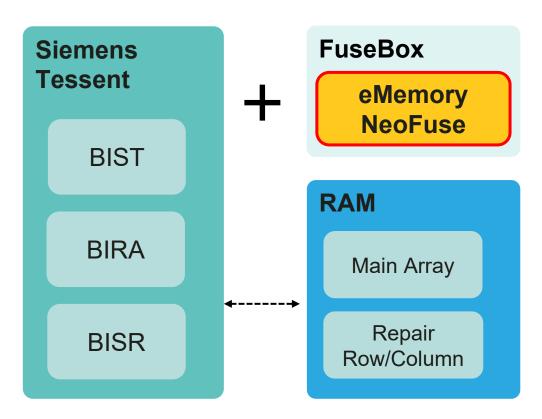

eMemory enables High-Yielding SRAM _

SRAM yield decreases as technology is scaled due to smaller dimensions. To increase yield,
 eMemory's OTP is required.

page 25

Partnering for Success: eMemory and Siemens -

BIST = Built-in Self Test

BIRA = Built-In Redundancy Analysis

BISR = Memory Built-in Self Repair

eMemory provides OTP with interface for Siemens MBIST:

- Tessent provides memory BISR functions with BIST and BIRA
- NeoFuse OTP provides defect-free OTP using BIRA, BISR and adapter to Tessent
- New MBISR: Tessent MBISR + NeoFuse, scanning defective SRAM by word/column and logging to the OTP

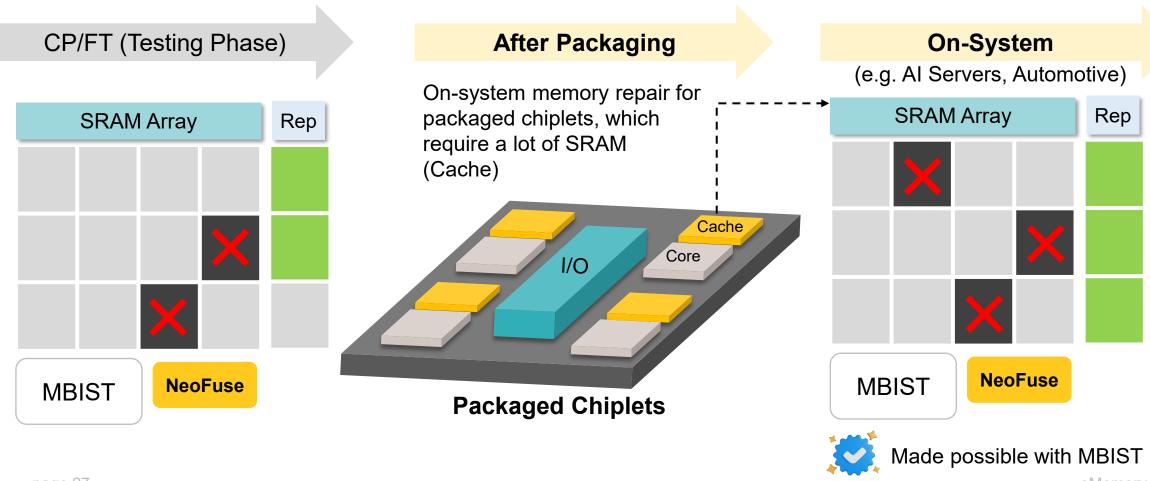

- 1. Compact
- 2. Flexible
- 3. Robust

page 26 eMemory

On-System Repair for Al Accelerators _

Memory Built-in Self-Test (MBIST) offers on-system repair capabilities, which are essential for high-speed high-reliability applications and chiplet architecture or after system packaging.

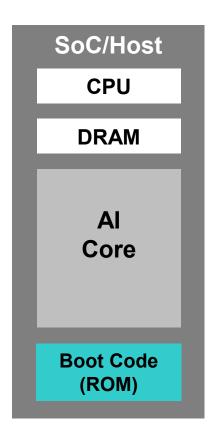

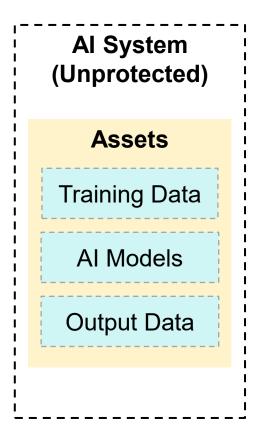

page 27

eMemory enables HPC in Al Applications

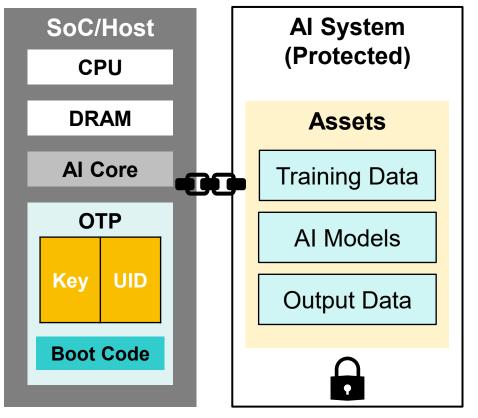

eMemory's OTPs can also store boot codes, root key and unique ID for the root of trust in AI systems.

Without eMemory OTP

With eMemory OTP

page 28

Why **PQC** Needs **PUF?**

PUF can **efficiently generate keys with long length**, which is needed for PQC.

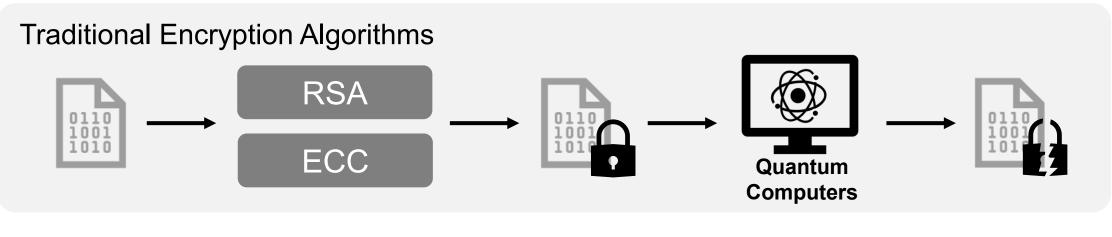

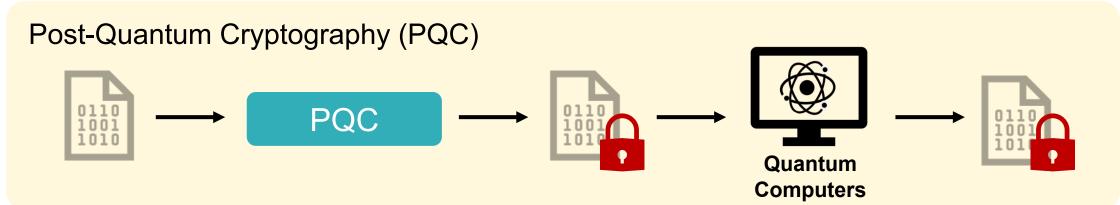

PUF can **efficiently provide random numbers**, which are needed for **anti-tampering** in PQC.

page 29 eMemory

What is **PQC?**

 PQC aims to create cryptographic systems that can withstand attacks from quantum computers.

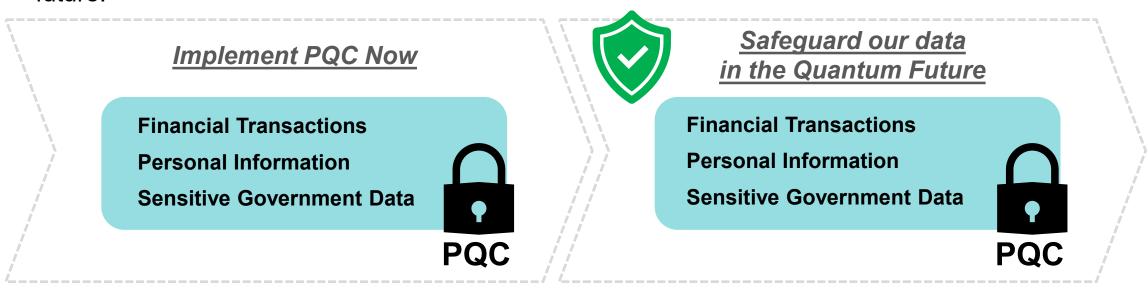

page 30 eMemory

Why is **PQC** Needed?

- As quantum computing progresses, the demand for encryption capable of resisting quantum attacks becomes critical.
- The sooner we implement PQC, the sooner we can guarantee the security of our data in a quantum future.

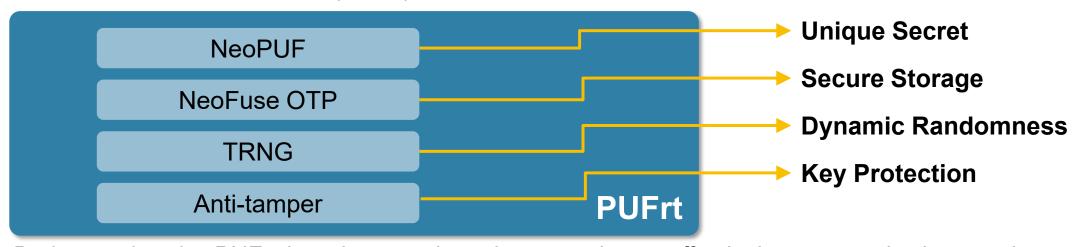

- In 2024, NIST officially announced three standards for PQC:
 - FIPS 203, Module-Lattice-Based Key-Encapsulation Mechanism Standard
 - FIPS 204, Module-Lattice-Based Digital Signature Standard
 - FIPS 205, Hash-Based Digital Signature Standard

page 31

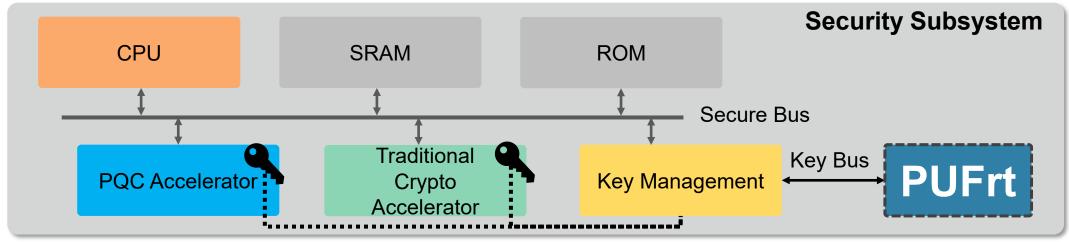

eMemory

How PUF-based Solutions Help PQC?

Our PUF-based Root of Trust (PUFrt) can help PQC:

 By integrating the PUFrt into the security subsystem, it can effectively manage the long and complex keys required for PQC algorithms.

page 32 eMemory

Why Migrate to PQC?

Future-Proof Security for the Quantum Era

Eliminate risks posed by quantum computing threats

Adopt PQC-Ready HSM Edge Servers

Support both RSA/ECC and PQC crypto algorithms

PQC Migration Steps & Scope

Key Principles:

- Execute Clear Migration Steps
- Prioritize Critical Digital Assets
- Deploy PQC-ready HSM Edge Servers

Select from FIPS 203/204/205 Validate PQC integration for key exchange & signatures via software and key system to ensure stability

Assess Choose PQC Ensure Agility PQC Testing Migration Monitor

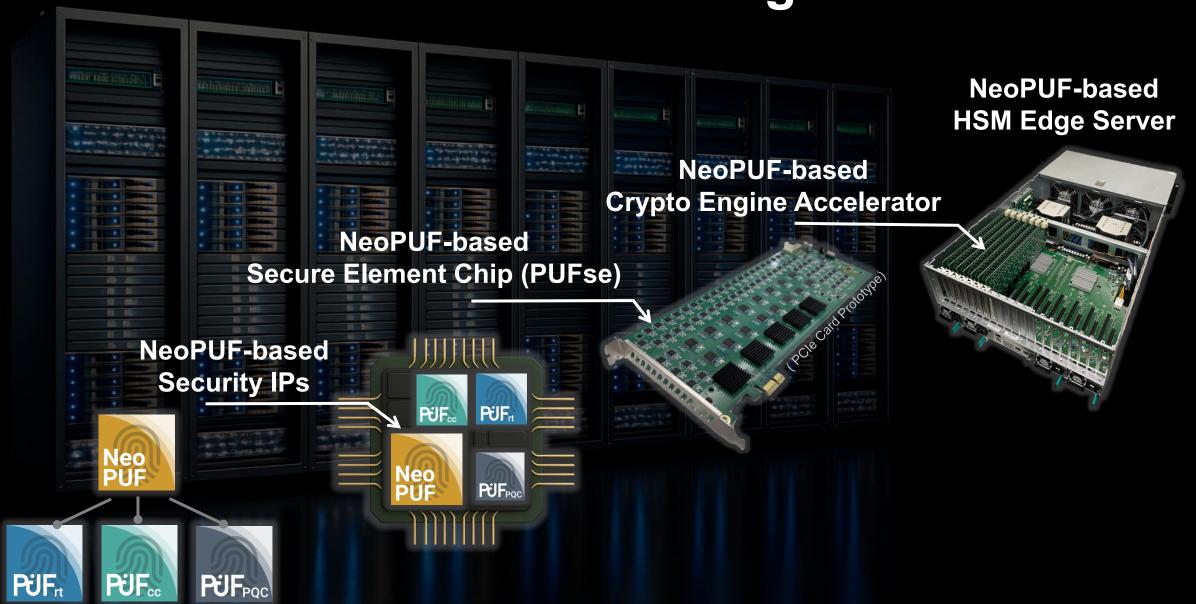

Identify key databases and prioritize upgrades

HSM must support PQC, ECC, RSA (e.g., TLS, IPSec)

RSA → PQC
 ECC → PQC

• AES128 → AES256
